What are other ways you can get involved?

Joining a clinical trial that tests a new treatment for your illness or condition is only one way to participate in clinical research. Here are other ways to participate:

- Volunteer for an observational study that only collects health data.
- Join a trial as a “healthy volunteer” so researchers can collect data on how a new treatment acts in the body before giving it to patients.
- Sit on an institutional review board or a patient advisory board.
- Talk with your family and friends to raise awareness about clinical research in your community.

Remember that participating in a clinical trial is optional. You can withdraw your consent to participate at any time for any reason. The staff at the trial site will help you to do this safely.

How can you find more information?

If you have a specific condition, the patient advocacy organization for your condition may have a list of clinical trials. Your doctor may also know about clinical trials for your condition. If you would like to learn more about current clinical trials, call 1-877-MED-HERO.

For more information on the topics in this brochure, go to: findingtreatmentstogether.org

This brochure was developed together with members of African American and Black communities and experts who work within those communities. It was also user-tested and reviewed with patients, the public and health professionals. They all helped to make sure it is clear, non-biased and culturally relevant.

Produced by

CISCRP is an independent non-profit organization dedicated to engaging the public and patients as partners in the clinical research process.
CISCRP does not recruit patients for clinical trials and does not conduct clinical research. CISCRP is also known as the Center for Information and Study on Clinical Research Participation.

Sponsored by

The American Gastroenterological Association (AGA) is the trusted voice of the GI community. Founded in 1897, AGA has grown to include more than 16,000 members from around the globe who are involved in all aspects of the science, practice and advancement of gastroenterology.

This program was supported by an educational grant from AbbVie Inc.; Amgen; Bristol-Myers Squibb Company; Genentech, a member of the Roche Group; Janssen Biotech, Inc., administered by Janssen Scientific Affairs, LLC; and Takeda Pharmaceuticals U.S.A., Inc., and a quality improvement grant from Pfizer Inc.
Why are clinical trials important?

Clinical trials are the best way to find out if new treatments or vaccines work and how safe they are. If clinical trials show that a new treatment works and is safe, then it can be approved to be used by the people who need it. Not all clinical trials test a new treatment or vaccine. “Observational” studies collect information about people’s health during their normal care. This helps researchers learn more about specific health issues.

The importance of clinical trials for IBD

Inflammatory bowel disease, or IBD, is a medical condition where a person has chronic inflammation in their digestive tract. The two most common types of IBD are Crohn’s disease and ulcerative colitis (UC).

Why should clinical trials have diverse participants?

Treatments and vaccines might not work the same in people of different races, ethnicities, ages or sexes. To find treatments and vaccines that work and are safe for everyone, people from all backgrounds need to be represented in clinical trials.

Why have Black and African American people not been represented in clinical trials?

Black and African American people are not always made aware of opportunities to participate in research. The research community is actively working towards including Black and African American participants in clinical trials to make sure that treatments work and are safe for people in these communities.

The Tuskegee study, 1932 to 1972

The Tuskegee study is an example of poor treatment of research participants. In this study, researchers withheld a treatment for syphilis from Black male participants. This unjust treatment led to the requirement that all clinical trials need to be reviewed and approved by an IRB before they can start.

Tuskegee Study, 1932 to 1972

The Tuskegee study is only one reason why some people may mistrust doctors or the research community. Unequal treatment of Black and African American people continues to exist in our modern health care system. By acknowledging these inequalities, researchers can take steps to correct them and to make sure that Black and African American people receive unbiased treatment.

How are you protected if you participate?

Federal laws and guidelines protect the safety of clinical trial participants. Clinical trials must:

• Follow guidelines that make sure trials are ethical.
• Include a process called informed consent to fully inform people about the trial before they can agree to be in it.
• Be approved by an expert group called an institutional review board, also called an IRB, that makes sure the trial is fair and as safe as possible.

What are the risks and benefits of participating in a clinical trial?

Possible risks

• The treatment in the trial may not help you.
• You may have side effects from the trial treatment.
• You may have blood draws, colonoscopies, or frequent testing.
• You may need to set aside time for participation.

Possible benefits

• You may have early access to advanced treatments for your condition.
• You may have access to treatment when no approved treatment exists.
• You will help researchers learn more about how a treatment affects your community.
• Your health will be watched by the trial doctors and nurses.

If you are thinking about participating in a clinical trial, be sure to talk with your doctor about the risks and benefits that may apply to you.
